Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 6, Application US/08826611
Patent No. 6031154
GENERAL INFORMATION:
PAPPLICANT: Bennett, Alan B.
APPLICANT: Ranayama, Yoshinori
TITLE OF INVENTION: Pructokinase Genes and Their Use in
TITLE OF INVENTION: Metabolic Engineering of Fruit Sweetness NUMBER OF SEQUENCES: 6
CORRESPONDENCES ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 3170;
                                                                                                                                                                                                                                           APPLICANT: Donadio, S
APPLICANT: Katz, L
APPLICANT: Mcalpine, J B
TITLE OF INVENTION: Method of Directing Biosynthesis of
TITLE OF INVENTION: Specific Polyketides

                                                                                                                                                                                                                                                          ö
                                                                                 comprising of a tumour homing molecule that selectively homes to a mammaalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammaalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
        Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    see AAR07413 and AAR08165-67) contains the Neo structural gene or its deriv. with, except for the region upstream of the translation initiation codon, and the translation initiation codon itself. A additional ATG sequences present. A plasmid contg. this sequence an also comprise a promoter. The combination of plasmids having different expression powers, results in various kinds of regulatory sequences having different expression capacities which can be measured quantitatively. See tag b of AAQ06275.
                                              The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is a modified Tn5 (transposon 5) transposase enzyme sequence that has both greater avidity for Tn5 outside end (OE) repeats and is less likely to assume an inactive multimeric form than a wild type Tn5 transposase. This can be used in the construction of novel genetic constructs which comprise this Tn5 transposase encoding nucleotide sequence and a transposable DNA sequence flanked at its 5' and 3' ends by an 18 or 19 base pair flanking DNA sequence comprising nucleotide A to position 10, T at 11 and A at 12. The modified Tn5 transposase and the transposable DNA which is a DNA donor molecule are used in a system of the transposable DNA which is a DNA donor molecule are used in a system for in vitro transposition. The system and method can be used to create absolute defective mutants, to provide selective markers to target DNA, to forcibliate in service insertion of specialised DNA sequences into target DNA, to facilitate primer binding sites or tags for DNA sequencing, to facilitate production of genetic fusion for gene expression studies and protein domain mapping, as well as to bring together other desired combinations of DNA sequences (combinatorial genetics). The modified Tn5 transposase facilitates in vitro transposition reaction rates of at least about 100-fold higher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified Tn5 transposase construct used in novel system for in vitro transposition - used to, e.g. create absolute defective mutants, provide selective markers and to facilitate insertion of specialised DNA sequences into target DNA

```
This sequence represents mutant Tn5 transposase EK54 MA56 LP372. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avoidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the Oreside End (DE) terminic is due to the Lys residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAV42536). The mutation strongly alters the preference Tof the Iransposase (AAV42536). The mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini results in a transposase. Similar changes at position 54 to the name and position 47 (Thr to Pro change) also result in increased binding to the OE termini. The reduction in the formation of the inactive mutimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tof Transposase to Pro (LP372). This sequence also has a substitution of Than for miditype Met at position 56. This substitution prevents the translation of an inhibitor protein, the initiation creased.
                                                                                                                                                                                                                                                                                                                                                                                          ö
than can be achieved using wild type transposase (as measure in vivo). In vitro transposition using this system can also use donor DNA and target DNA that is circular or linear. The system also requires no outside high energy source and no other protein other than the modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified transposase enzyme for use in a system for introducing genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the wildtype Tn5 transposase. Various mutant forms of this enzyme were found to bind to the repeat sequences of donor bow with greater avidity than the wildtype. Mutants containing a substitution of Pro for Leu at position 372 (AAM42535, AAM42537, AAM42531, AAM42531, AAM42531, AAM42531, AAM42531, AAM42531, AAM42537, AAM42537, AAM42537, AAM42537, AAM42537, AAM42537, AAM42539, AAM42537, AAM42539, AAM42537, AAM42537, AAM42539, AAM42537, AAM42737, AAM
                                                                                                                                                 transposase enzyme is useful in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective markers to target DNA, to provide portable regions of homology to a target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequencing, and to facilitate production of genetic fusions for gene expression studies and protein domain mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified transposase enzyme for use in a system for introducing genetic
corresponds to the sequence encoding wildtype Met 56. As a result, the mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. The mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transposase; modified form; wildtype; mutant; multimeric; OE termini; IE termini; outside end termini; inside end termini; repeat sequence; mutation; mutein.

char42538, AAY42540) and position 47 (Thr to Pro change, TP47, AAY42542))

also result in increased binding to the OE termini. Mutants with a also result in increased binding to the OE termini. Mutants with a substitution of Ala for wildtype Met at position 5 exhibited a higher transposition rate than the wildtype. This substitution prevents the transposition rate than the wildtype. This substitution prevents the carnal action of an inhibitor protein, the initiation codon of which corresponds to the sequence encoding wildtype Met 56. The TR5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Th10-based systems. The mutant transposase enzyme is useful in a system for introducing genetic changes to nucleic actid. The method can be applied to create absolute defective mutants, to provide selective markers to target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences categorical statics and protein domain mapping.

Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents mutant Tn5 transposase EK54 LP372. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the repeat sequences for the Outside End (OE) termini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified transposase enzyme for use in a system for introducing genetic

is due to the Lys residue at amino acid 54, which is Glu in wild type Transposase (AAV12536). The mutation strongly alters the preference of the transposase (Dr. the OB termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini results in a transposaic. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tn5 transposase to Pro (LP372). The Tn5-based transposation system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. The modified transposase enzyme setul in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective markers to target DNA, to provide portable regions of homology to a target DNA, to provide primer binding sites or tags for DNA sequencing, and to facilitate production of genetic fusions for gene where the produce of the provide selective markers contained production of genetic fusions for gene where the produce of the provide selective markers of acilitate production of genetic fusions for gene where the produce of the provide production of genetic fusions for gene where the production of genetic fusions for gene where the production of genetic fusions for gene where the production of provide selective markers and protein domain mapping.

This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype In5 transposase and it is less likely than the wildtype protein to assume an
                                                                                                                                                                                                                                                                                                                                                                                                                                   derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified transposase enzyme for use in a system for introducing genetic

Transposace for the repeat sequences for the Outside End (OE) termini is due to the Val residue at amino acid 54, which is Glu in wild type is due to the Val residue at amino acid 54, which is Glu in wild type fransposace (AAV4236). The mutation strongly alters the preference of the transposace for the OE termini, as opposed to the Inside End (IE) termini results in a transposace. The reduction in the formation of the cermini results in a transposace. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tr5 transposace to Pro (L972). The Tr5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tull-based systems. The modified transposace enzyme is useful in a system for introducing genetic changes to nuclaic acid. The method can be applied to create absolute defective mutants, to provide selective marget DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequencing, and to facilitate production of genetic fusions for gene expression studies and productin domain mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                               Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid \dot{\mathbf{c}}

                                                                                                                                                                                                                                                                                         ö
          transposase. The improved avoidity of the modified transposase. The improved avoidity of the modified transposase for the repeat sequences for the Outside End (OE) terminist due to the Lys residue at amino acid 54, which is Glu in wild type Tn5 transposase (AA42536). The mutation strongly alters the preference of the transposase for the OE termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini. The higher transposition rate that is about 10-fold higher than seen with wild-type transposase. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents mutant Tn5 transposase EV54. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater aviality than the wildtype Tn5 transposase. The improved aviality of the modified transposase for the repeat sequences for the Outside End (OE) terminis due to the Val residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAYA2536). The mutation strongly alters the preference of the transposase for the OE termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as EV54, to OE termini results in a transposition rate that is about 3-fold higher than
                                                                                                                                                                       Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid \dot{\mathbf{c}}

                                                                               Note: The present sequence is not shown in the specification but is derived from the mutant In5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents mutant Tn5 transposase LP372. This mutant form differs from the wildtype in that it is less likely than the wildtype protein to assume an inactive multimeric structure. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tn5 transposase to Pro (LP372). The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are
system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared Mu- and Tn10-based systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transposase; modified form; wildtype; mutant; multimeric; OE termini; IE termini; outside end termini; inside end termini; repeat sequence; mutation; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents mutant Tn5 transposase TP47. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype Tn5 transposase. The improved avidity of the modified transposase or the repeat sequences for the Outside End (OE) terminity of the modified transposase for the repeat sequences for the Outside End (OE) terminity of the pro residue at maino acid 47, which is Thr in wild type of the transposase (AAV4536). The mutation strongly alters the preference of the transposase for the Outside End (IE) terminity The higher binding of this mutation, known as TP47, to OE terminity results in a transposition rate that is about 10-fold higher than seen with wild-type transposase. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to will apply that are active on DNA of any structure when compared to the transposition that are active on DNA of any structure when compared to will apply that the transposition that are active on DNA of any structure when compared to the transposition that are active on DNA of any structure when compared to the transposition that the transposition that the acid th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The present sequence is not shown in the specification but is derived from the mutant In5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified transposase enzyme for use in a system for introducing genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          JS5965443-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-0CT-1999
```

```
This sequence represents mutant Tn5 transposase MA56. This sequence has a substitution of Ala for wildtype Met at position 56. This substitution prevents the translation of an inhibitor protein, the initiation codon of which corresponds to the sequence encoding wildtype Met 56. As a result, the mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that active on DNA of any structure when compared to Mu- and Tn10-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified transposase enzyme for use in a system for introducing genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                             This sequence represents mutant Tn5 transposase EK54 MA56. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avoidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avoidity of the modified transposase for the routside End (DE) terminic is due to the Lys residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAY42536). The mutation strongly alters the preference CC of the transposase for the Ose terminic The higher binding of this mutation, known as EK54, to OBE terminic The higher binding of this mutation, known as EK54, to OBE terminic results in a transposition rate that is about 10-fold higher compared to the negative prevents the translation of an inhibitor protein, the initiation codon of prevents the translation of an inhibitor protein, the initiation codon of the mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and cullises shorter, more well defined terminic that are active on DNA of any structure when compared to Mu- and Tn10-based systems.

CC derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```

```
This is the amino acid sequence containing the modified form of the Transposase enzyme. This modified form differs from the wildtype in that the index to the repeat sequences of the donor DNA with greater avidity than the wildtype Tn5 transposase and it is less likely than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure.

The improved avidity of the modified transposase for the repeat caquences for the Outside End (OE) termini (class (1) mutation) can be achieved by providing a lysine residue at amino acid 54, which is glutamic acid in wild type Tn5 transposase. The mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini results in a transposase. Similar changes at position 54 to valine and position 47 (threonine-to-proline change) also result in increase binding to the OE termini.

The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (leucine) of wildtype Tn5 transposase to a proline (class (2) mutation, LP372).

The Th5-based transposition system is more broadly applicable and this increase shorter more well defined remaining that are acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NNA of any structure when compared to Mu- and Tn10-based systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

AAY48905

RESULT

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to ampigoenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is a homing peptide isolated in the present invention, which can be conjugated to an antimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention.
                                                                  The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and Iymph node. The peptide bind to the membrane dipeptidase (MDP). AAY48618 to AAY49066 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is mouse prostate homing peptide. This sequence is useful in the homing of pro-apoptotic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

ö
Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                        Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                          Mizoguchi H, Ando S, Hayashi M, Ochiai K, Yokoi H;

                                                                                                                                                                                                       sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived
                                                                                                                                                                                                                                                                    from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, uncleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                              mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

                             AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genttal diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; novel protein; Antianaemic; osteopathic; antiinflammatory; immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antiviral; antibocterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides can be used to the polypeptides are used to identify compounds which bind to the

polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine dual activity, to raise antibodies/elloit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating purns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthitis, anaemia, alzheimer's Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, arti-inflammatory diseases, nervous system disorders, and infection.

The present sequence represents a protein of the invention.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; heaptorcopic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimilant; cardiant; thrombolytic; coaqulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; and note of or preventing or treating pathological conditions and nucleic acids may be used to treat cancers; proliferative disorders, neurodegenerative disorders, osteoarthritis, collection, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic caneemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B
                                                                                                                        The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                            ö
                                     Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

```
metabolism and oxidative phosphorylation (SMP) proteins given in metabolism and oxidative phosphorylation (SMP) proteins given in metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of corprebacterium diphtheriae in a subject. (I), (II), (II) or host cells containing them are used to map genomes of organisms related to nevolutionary studies, in determining SMP protein regions required for function, in modulating SMP protein activity, in modulating the metabolism of sugars, and in modulating high-energy molecule production in a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated Corynebacterium glutamicum nucleic acid encoding a sugar metabolism and oxidative phosphorylation protein for production or modulation of production of fine chemicals e.g. amino acids, carbohydrates or enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
     Isolated retinoid X receptor protein - having amino acid insert in ligand binding domain, useful to identify specific target genes implicated in retinoid responses important in disease states
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel retinoid X receptors RXR delta (AAW18032) and RXR epsilon (AAW18033) exhibit a high degree of amino acid conservation with other vertebrate RXRs but represent unique subtypes defined by an additional 14-amino acid segment in their ligand binding domains. These RXRs do not bind 9-cis retinoic acid (RA) or all-trans RA with high affinity and are not activated by 9-cis RA. They are able to form dimers in a manner equivalent to other RXRs. Their amino acid sequences were deduced from cDNA clones (AAMF67196-97) obtd. from adult and post-somitogenesis zebrafish cDNA libraries. The RXRs can be used to identify ligands, isolate mammalian counterparts, modify retinoid activity and identify target genes implicated in retinoid responses important in disease states.
                                                                                                                                                                                                                                                                          /note= "hinge between DNA-binding and ligand-binding domains"

AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide and protein sequences isolated from eucalyptus (Bucalyptus grandis) or pine (Phnus radiata also known as Wonterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism: Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance considerations can be used to delay senescence of Ireproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           24444400,

Sequence 27, Application US/08723306
Patent No. 3856178
GENERAL INFORMATION:
APPLICANT: White PhD, Kenneth
APPLICANT: Morrey PhD, John
APPLICANT: Correy PhD, John
APPLICANT: Reed, William
TITLE OF INVENTION: Cassette for Expression of Lytic
TITLE OF INVENTION: Peptides in Mammalian Transgenic Organisms
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

MEDIUM TYPE: Floppy disk
COMPOTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/944,133
FILING DATE: 06-0CT-1997
CLASSIFICATION: 5530
PRIOR APPLICATION NUMBER: 08/789,077
FILING DATE: 03-FEB-1997
APPLICATION NUMBER: US/08/681,075
APPLICATION NUMBER: US/08/681,075
                                                                                                                                                                  Sequence 27, Application US/08944133
Patent No. 5785942
GENERAL INFORMATION:
APPLICANT: McLaughlin, Mark L
APPLICANT: Becker, Calvin L
TITLE OF INVENTION: SAmphipathic Peptides
NUMBER OF SEQUENCES: 54
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ohn H. Runnels
STREET: P. O. Box 2471
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-08-944-133-25
Sequence 25, Application US/08944133
Patent No. 5789542

useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such antimicrobial peptide, which can be conjugated to a homing peptide to make the homing pro-apoptotic conjugates of the present invention. The present sequence has an amphipathic alpha-helical structure.
                                                                                                                                                                   Conservative

                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are
                                                                                       charged amino acid residues, or five nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues and the positively charged amino acid residues are distributed within the hepted such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                               AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively.
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         breast; prostate; melanoma; cancer; Kaposl's sarcoma; amphipathic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; homing pro-apoptotic conjugate; tumour; antimicrobial;

The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a synthetic anti-microbial peptide having an amphipathic-alpha helical structure. This peptide is linked to a prostate-homing peptide to generate a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel chimeric prostate-homing pro-apoptotic peptide, used to trea prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide is an analogue of a known lytic peptide. It comprises an alpha helical conformation of amino acids. It is effective at lysing e.g. gram-positive and -negative bacteria and mammalian_neo-plastic cells, cells infected with intracellular pathogenic micro-organisms such as HIV. It stimulates the proliferation of fibro-blasts and-lymphocytes-and-can-be-used-in-wound-healing:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lytic peptide; channel forming peptide; antibacterial; amphipathic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NAME OF THE PART O
```

```
AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively the positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues and the positively charged amino acid residues and the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                             õ
                                                                                                                                                                                                                                                                                                 ö
                                                                                                             AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively the positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the anoppolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The

The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such
toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the miliner forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell exoxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

/label= Membrane_disrupting; This region forms an
mphipathic helix and is useful in imparting increased
stability of the conjugate in vivo"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, to a patient with prostate cancer. The present sequence is chimeric prostate-homing pro-apoptotic peptide, HPP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing pro-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proapptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                    This peptide is an analogue of a known lytic peptide. It comprises an alpha helical conformation of amino acids. It is effective at lysing e.g. gram-positive and -negative bacteria and mammalian neoplastic cells, cells infected with intracellular pathogenic microorganisms such as HIV. It stimulates the proliferation of fibroblasts and lymphocytes and can be used in wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; homing pro-apoptotic conjugate; tumour; antimicrobial; breast; prostate; melanoma; cancer; Kaposi's sarcoma; amphipathic; alpha-helix; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma breast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                    Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                        Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

```
The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                Homing pro-apoptotic conjugate comprising a tumor homing molecule that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an
                              selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer

prostate cancer, comprantimicrobial peptide

```
The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                     The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; homing pro-apoptotic conjugate; tumour; antimicrobial; breast; prostate; melanoma; cancer; Kaposi's sarcoma; amphipathic;

toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;

The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer-
to direct an antimicrobial peptide in vivo to a prostate cancer, to induce salective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is chimeric prostate-homing pro-apoptotic peptide, HPP-1.
                                                                                                                                                          Gaps

The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing pro-

The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proapptotic peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell excitity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such

Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proappototic peptide. This peptide inhibits retinal neovascularisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ő
                                                                                                                                                                                                                                                                  The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to ampliogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule; cytostatic.

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                peptides have antibacterial properties in concentrations not lethel toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues are not the positively charged amino acid residues. The nonpolar amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues and three positively two positively charged amino acid residues. The nonpolar amino acid residues and the heptad such that when the multimer forms an alpha-helix the monpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the anophalar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
charged amino acid residues, or five nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix,
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lytic peptide; channel forming peptide; antibacterial; amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Selective lysis of bacteria amongst mammalian cells – using 14-mer or 21-mer lytic peptides
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                             Length 28;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 28;

The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are neptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively two positively charged amino acid residues. The nonpolar amino acid residues and the heptad such that when the multimer forms an alpha-helix the morpolar amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the and the positively charged amino acid residues will lie on one face of the alpha helix, and the positively charged amino acid residues will lie on the opposite face of the alpha -helix, whereby the multimer is amphipathic.
